IDAHO  
FRUIT TREE CENSUS  
1980

FOREWORD

The 1980 biennial Fruit Tree Census was conducted as a joint effort by the Idaho State Department of Agriculture and the Idaho Crop and Livestock Reporting Service of the U. S. Department of Agriculture. The State Fruit and Vegetable Inspectors collected the data from each operation. Summarization and publication were done by the Idaho Crop and Livestock Reporting Service. University of Idaho Extension Service also provided some technical assistance. Appreciation is extended to all who helped with this project and especially to all the fruit growers for their cooperation.

# IDAHO COMMERCIAL FRUIT TREE CENSUS - 1980

## STATE SUMMARY

The 1980 Idaho Commercial Fruit Tree Census showed 1,237,425 fruit trees in 218 commercial operations. This was a 10 percent increase in the number of trees since the last census taken in 1978. It has become increasingly common for an operator to have more than one orchard. Because of this, the definition by which to count the number of units was changed from "number of orchards" to "number of operations". In 1980 there were 218 commercial operations in Idaho. The number of acres devoted to fruit increased by 625 to 12,152 from 1978 to 1980. This was a 5 percent increase. The total trees of bearing age at 867,056 showed a 2 percent decrease during the same period. Trees of bearing age account for 70 percent of the total trees compared to 78 percent two years ago.

Apples remain the leading commercial fruit, with 69 percent of the total fruit trees. This compares with 62 percent in 1978. Following apples in order by tree numbers were peaches, plums, sweet cherries, prunes, pears, sour cherries, apricots and nectarines.

### STATE SUMMARY: NUMBER OF NON-BEARING, BEARING AND TOTAL TREES

## APPLES

Apples accounted for 69 percent of the total fruit acreage. Standard varieties were planted on 55 percent of the total apple acreage. This was 9 percentage points lower than the previous survey.

Fruit operations reporting apples averaged 29.3 acres for the standard varieties and 26.9 acres for the dwarf varieties. The number of trees per operation averaged 2,295 for standard varieties and 3,501 for the dwarf varieties.

The number of trees per acre on apple operations averaged 78.3 for standard varieties compared with 72.4 in 1978. Dwarf variety trees per acre averaged 130.2, the same as the last survey.

IDAHO COMMERCIAL FRUIT TREE CENSUS - 1980

APPLES

As in the past surveys, Red Delicious continues to be the favorite apple variety although losing some ground. Totaling standard and dwarf trees, Red Delicious accounts for 61 percent of the total trees. Red and Black Rome Beauty, Golden Delicious, and Red and Black Jonathans make up 38 percent of the total.

Dwarf and semi-dwarf varieties again gained in importance. The total number of trees in the dwarf category was 41 percent greater than the previous survey, while the standard varieties showed only a 4 percent increase.

PEARS

Pear tree numbers reversed a downward trend and showed a 9 percent increase over the 1978 survey. While the number of bearing age trees was 7 percent less than the previous survey the number of non-bearing age trees, which represents new plantings, was almost five times greater than 1978. The 48 commercial operations averaged 104 trees per acre. Bartlett continued to be the most prevalent variety with 89 percent of all pear trees.

PEACHES

A total of 85 operations reported peaches during 1980. This was 39 percent of all fruit operations. Peach trees totaled 107,118, down 16 percent from the previous survey. The number of trees has decreased in three out of the last four biennial periods. The acres of peaches at 980 is down 8 percent from two years earlier. Trees per acre at 109 is a decline of 11 trees per acre from 1978. Hale, Improved Elberta and Red Globe were the three predominant varieties accounting for 69 percent of the peach trees. The decrease in peach tree numbers occurred in the trees of bearing age. Trees not yet bearing increased from about 7,000 trees in 1978 to just over 16,000 in 1980.

PRUNES

Again, during the last biennial survey period, the prune industry in Idaho declined. This continues a downward trend started in 1966. The 1980 survey counted 67,204 trees, down 20 percent from two years ago.

Italian prunes, again, were the most popular variety with 77 percent of all trees.

This survey found only 317 trees of non-bearing age compared to 5,214 two years ago, meaning fewer new trees were planted.

PLUMS

Total trees reported at 91,561, are 9 percent less than the previous survey. There were 813 acres planted to plums, 93 fewer acres than two years ago.

President continued to be the most important variety although Empress gained ground since the last survey. President, with 33,332 trees had 36 percent of all trees and Empress accounted for 32 percent of the trees.

SWEET CHERRIES

A total of 70,009 sweet cherry trees of all ages was reported, 2 percent more than in 1978. While the number of bearing age trees decreased from the previous survey, the number of non-bearing trees increased from 555 to 3,833 in the two year period.

Bing and Lambert varieties continue to dominate the sweet cherries, accounting for 88 percent of the total sweet cherry trees.
